Project Design Phase
Problem – Solution Fit Template

Date	28 September 2026
Team ID	SWTID-2026-2598
Project Name	AI BlogNest API
Maximum Marks	2 Marks

1. Customer Segment(s)

Independent bloggers, students, and small content teams who publish written content regularly; readers who consume blog content.

2. Jobs-to-be-Done / Problems

Need to research, write, and publish blog posts regularly; need a quick way to summarize long content for readers.

3. Triggers

Seeing competitor blogs publish more frequently; approaching a self-imposed content calendar deadline; needing a quick summary for a long article.

4. Emotions: Before / After

Before: overwhelmed, rushed, inconsistent. After: relieved, confident, and able to publish consistently.

5. Available Solutions

Manual writing; hiring freelance writers; using generic AI chat tools (e.g. ChatGPT) outside the blogging platform and copy-pasting the result in.

6. Customer Constraints

Limited time, no dedicated writing/editing staff, and limited budget for premium standalone AI writing tools.

7. Behaviour

Writers draft posts in a separate document or tool, then paste the result into the blog platform, and manually shorten text for previews or social captions.

8. Channels of Behaviour

Online: blog CMS, Google Docs, ChatGPT web app. Offline: handwritten notes and outlines.

9. Problem Root Cause

Content creation and summarization are inherently time-intensive manual tasks, and traditional blog platforms provide no built-in AI assistance for either.

10. Your Solution

AI BlogNest API lets an authenticated user generate a structured draft from a topic and summarize any content, directly inside the same backend used to manage their blogs — removing the need to switch to a separate writing tool.
