Project Design Phase
Proposed Solution Template

Date	28 September 2026
Team ID	SWTID-2026-2598
Project Name	AI BlogNest API
Maximum Marks	2 Marks

S.No.	Parameter	Description
1	Problem Statement (Problem to be solved)	Bloggers and small content teams spend excessive time researching, drafting, and summarizing blog posts manually, which limits how consistently they can publish.
2	Idea / Solution Description	AI BlogNest API is a secure, JWT-authenticated blogging backend that integrates Google Gemini AI to generate a structured first-draft blog post from just a topic, and to summarize any block of content into a short paragraph on demand — alongside full blog CRUD management.
3	Novelty / Uniqueness	Combines traditional CRUD-based blog management and AI content generation/summarization inside a single authenticated REST API, so generated content is treated identically to manually written content (same ownership rules, same endpoints), instead of requiring a separate AI tool.
4	Social Impact / Customer Satisfaction	Reduces the time and effort barrier to consistent publishing for independent bloggers and small teams, and gives readers quick, digestible summaries of longer articles.
5	Business Model (Revenue Model)	Freemium API access: a free tier with limited AI generations/summaries per month, and a paid tier offering higher usage limits, priority processing, and premium AI models.
6	Scalability of the Solution	Stateless JWT authentication allows

		the Express server to scale horizontally behind a load balancer; MongoDB can scale via Atlas clusters/sharding; the AI layer can add caching or alternate model providers as usage grows.
